

PENETRATION TESTING

FROM AWARENESS TO SECURITY

Penetration Testing, or ethical hacking, is the art of attacking systems to ensure that they are as secure as possible. Layer 3 Communications can provide advanced adversary emulation, to help verify that your security infrastructure is working as intended.

Our expert penetration testing team simulates an actual attack on your network to educate you on avenues of attack that you may have failed to defend yourself against. These vulnerabilities can exist in operating systems, services and application flaws, improper configurations or risky user behavior. Our attacks give you an excellent picture of how a hacker would attempt to gain access to your network, further allowing you to strengthen your security.

REASONS YOU NEED PENETRATION TESTING?

- Meet compliance with industry standards
- Avoid the cost of network downtime
- Preserve corporate image and customer loyalty
- Intelligently manage vulnerabilities
- Identifying the right areas for investment

The objective of any penetration test is to look for vulnerabilities in your network that you haven't identified, exploit them, and determine their impact. Our services go beyond that, and provide both in-depth reporting of our results, as well as a comprehensive plan to address the issues discovered. Let Layer 3 Communications give you the trust in your systems that you need!

The hackers may be getting smarter, **but so are we!**
